Studies on the measles show: There is prevention and healing through Vitamin A.

Welcome! Here's another media commentary on the subject: Studies of measles show: There is prevention and healing through Vitamin A.

In our previous media commentary we showed that the decrease of measles infections in the 19th and 20th century obviously cannot be linked with the measles-vaccination. What is the cause for the decrease in measles infections, what are the correlations here?

Dr. Paul Hoepfich, M.D., previously professor of internal medicine in the U.S., and specialist in infectious diseases wrote in 1972, quote: "Measles remains one of the leading causes of childhood mortality in countries where malnutrition, poor sanitation, and inadequate medical care are prevalent... Measles is often a fatal disease among socio-economically deprived children in tropical countries."

This explains the dramatic decrease of deaths caused by measles in the 19th and 20th century in the western world. Generally, the nutritional situation had improved during this time. The medical specialist Dr. Suzanne Humphries and the journalist Roman Bystryanik did research on this. In their book "Dissolving Illusions: Disease, Vaccines, and The Forgotten History" they write:

"As early as 1932, scientists found that mortality dropped by 58 percent when children hospitalized with measles were given cod liver oil, which contains vitamins A and D and omega-3 fatty acids.

In the 1970s there was a call to add Vitamin A to daily nutrition in order to get the measles under control in developing countries. In 1987 scientists used Vitamin A in a measles outbreak in Tanzania and had amazingly positive results.

By 2010 it was well accepted that supplementing with vitamin A during acute measles illness led to significant drops in both: adverse outcomes and death."

Vitamin A deficiency is once again observed in children of the western world as shown by a study in California in 1992.

50 per cent of children hospitalized with measles had a Vitamin A deficiency.

Besides Vitamin A, Vitamin C has also been shown to be effective against measles.

Dr. Fred R. Klenner, American medical researcher and doctor published a study in 1949, which is called:

"The Treatment of Poliomyelitis and Other Virus Diseases with Vitamin C."

During a measles-epidemic a high dosage of Vitamin C was given for prevention and it

showed as being highly effective. Furthermore, measles infections could be softened through high doses of Vitamin C.

Babies are protected from measles best through breastfeeding. For mother's milk contains a high dosage of Vitamin A and other effective substances that protect against the measles and soften the course of the disease.

A study from 2009 showed: Children that had been breast-fed more than 3 months had a 30 per cent less risk of being infected with measles compared to children that had never been breast-fed. The author of the study concludes that breastfeeding has a much higher influence in the prevention of measles than measles-vaccination.

Ladies and gentlemen, let's close with a quote made in 1992 by Adrienne Bendich, American Clinical Research Scientist in Human Nutrition:

"For over 100 years, there has been a strong association with vitamin A deficiency and adverse measles outcomes, especially in young children. Has the time come for the medical community to recognize that any child presenting with measles complications should be given vitamin A and evaluated for overall nutritional status? If not, then what has history taught us?"

Have a good evening!

from C.H.
